

PFAS reference standards and proficiency testing at Labmix24

Known colloquially as “forever chemicals” because of their resistance to degradation, PFAS (per- and polyfluoroalkyl substances) are of concern because they are bioaccumulative and suspected to cause cancer, infertility, and immune deficiencies. Regulatory authorities in many major markets are focusing on these contaminants of emerging concern.

Laboratories researching and monitoring PFAS contamination require accurate calibration and measurements. Labmix24 offers a wide range of PFAS reference materials including isotope labeled standards, matrix standards, and standard mixtures so that you can find the reference materials appropriate for your analytical needs. Standards from well-known manufacturers such as **Cambridge Isotope Laboratories (CIL)** and **ERA Waters** are represented in our range. Rounding out our PFAS portfolio are proficiency testing schemes as well as custom standards tailor-made to your requirements.
